Abstract:

In this paper, the power system station had many drawbacks at transient situation which deteriorate the automatic voltage regulator AVR with load frequency controller LFC. Therefore, to enhance this system, the programmable logic controller PLC is the best solution to solve this problem. The response of AVR and LFC with PLC make the system fast response and low overshoot without undershoot. The performance of whole system has high accuracy with high efficiency.

Key words: power system station, PLC, AVR, LFC.

INTRODUCTION

In the classical system, the AVR is widely used to adjust the voltage and to decrease harmonics to keep a continuous voltage to electrical instrumentation with the same load and high reliable power system [1]. Many researchers have done a lot of research on PLC with SCADA to enhance the system performance by adjusting voltage and frequency [2] [3]. In addition, thermal plants are also discussed based on PLC and Artificial Intelligence [4] [5].

PROPOSED METHOD

In this proposed method, PLC is used to optimize the system via a corrected PID controller.

The PLC is used to eliminate the over and under shoot as a result of decreasing the even and odd harmonics. The efficiency of the system will be optimized and enhanced. Figure 1 shows the proposed method.

000019	NOP							
000020	NOP							
000021	NOP							
000022	NOP							
000023	NOP							

CONCLUSION

In this proposed method, the PLC behavior as intelligent control to optimize the system performance based on power system station. The efficiency is optimized also therefore the artificial intelligent has the authority over classical system.
